

Conductor

Be connected with Conductor

Conductor

Conductor connects your school and puts the control at your fingertips.

Conductor allows schools to create zones, schedule and customise bells, and send out announcements with a few clicks — maximising control over the school without needing technicians.

Conductor uses the existing network and integrates with technology to reduce wiring redundancy and create one easy-to-manage system. Digital monitors and signs can display alerts and information, and speakers located around the school can play bells, pre-recorded announcements and instructions. Conductor also works as an intercom eliminating the need for IP phone systems.

Other Features

Can use an existing network to upgrade current systems

Easy to use software, with incredibly powerful scripting

Dedicated all-in-one PC and server

Available with a virtual server

Key Benefits

Future-proof technology

Conductor is designed to upgrade your existing PA and bells system and adapt with your school's needs. New technology is easily integrated making it a long-term, future-proof solution.

Messaging and Announcements

Pre-record messages and announcements to play at a scheduled time — allowing the principal and staff to record messages when it suits them.

Scheduling

Create standard bell schedules with a variety of sounds or music and set them to run automatically. If you need to change the schedule, it only takes a few clicks.

Zoning

Create virtual zones across the school and make pages to any or all of those zones over your network. If you need to change zones, Conductor makes it quick and easy — no need to call in a tech to rewire your PA.

Emergency Planning

Program Conductor for the situations you want to be prepared for. For example, hitting an emergency button can play a distinct alarm to all zones, display evacuation maps on screens, and play pre-recorded instructions over speakers.

Build an ecosystem

Conductor combines all your technology into a single communications ecosystem. Using one system makes it easier for staff to learn and manage, and eliminates wiring redundancy from having multiple systems.
